

IP5306 I2C REG

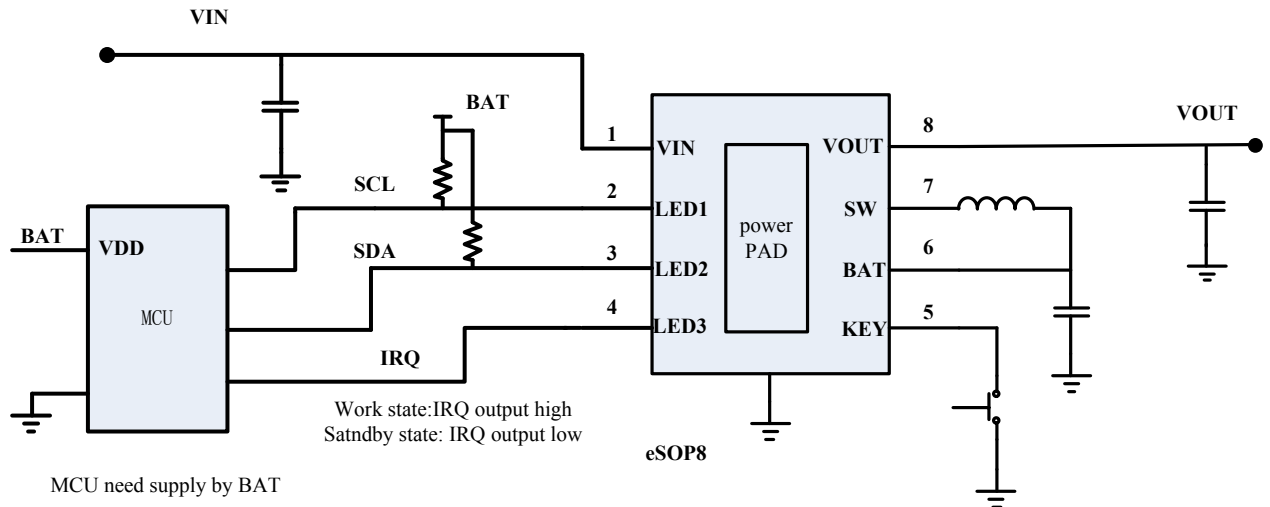

Figure1 IP5306 I2C典型应用电路

使用建议:

- 1、用IRQ信号判断5306是处于工作态还是待机态： IRQ=1时工作， IRQ=0时处于待机
- 2、用寄存器0x70的bit3判断5306是充电还是放电： bit3=1时充电， bit3=0时放电
- 3、用寄存器0x71的bit3判断电池是否已经被充满： bit3=1时充满， bit3=0时未充满

I2C interface

- The i2c speed support 400Kbps.
- Support 8 bit address width and 8bit data width.
- Transmit and receive MSB first.
- The default slave address is 0xea.

Registers are written to and read from the master through the I2C Interface. The IP5306I2C acts as slave and is controlled by the master. The SCK line of the I2C interface is driven by the master. The SDA line could be pulled up to BAT by a 1.5Kohm resistor and pulled down by either the master or the slave. A typical WRITE sequence for writing 8bits data to a register is shown in below figure2. A start bit is given by the master, followed by the slave address, register address and 8-bit data. After each 8-bit address or data transfer, the IP5306 gives an ACK bit. The master stops writing by sending a stop bit. All 8 bits data must be written before the register is updated.

Example: Write 8bit data 0x5a to register 0x05:

Note: sACK generated by Slave, mACK generated by Master

Figure2 I2C WRITE

A typical READ sequence is shown in below figure. First the master has to write the slave

address, followed by the register address. Then a restart bit and the slave address specify that a READ is generated. The master then clocks out 8 bits at a time to read data.

Example: Read 8bit data 0x5A from register 0x05:

Figure3 I2C Read

1. Register

标示为“Reserved”的寄存器位有特殊控制作用，不可改变原有的值，否则会出现无法预期的结果。对寄存器的操作必须按照“读-->修改-->写”来进行，只修改要用到的 bit，不能修改其他未用 bit 的值。

SYS_CTL0

Offset = 0X00

Bit(s)	Name	Description	R/W	Reset
